

Lectures on scattering theory in partial-wave amplitudes

J. A. Oller^{*a}

^a*Departamento de Física, Universidad de Murcia, E-30071 Murcia, Spain*

August 29, 2024

Contents

1	S and T matrices. Unitarity	5
2	Two-body scattering. Partial-wave amplitude expansions	5
2.1	Partial-wave amplitudes in the ℓSJ basis	5
2.2	Partial-wave amplitudes in the helicity basis	5
3	Crossing symmetry	5
4	The N/D method and CDD poles	5
5	General parameterization for a PWA and reaching unphysical Riemann sheets	5
6	Final(Initial)-state interactions. Watson theorem.	5
A	The Sugawara-Kanazawa theorem and number of subtractions in dispersion relations	5

Extended table of contents

1 S and T matrices. Unitarity

Free particle states □ Scattering states, in and out states, and the Möller operators □ S -matrix elements, and the S -matrix operator □ Expression in perturbation theory □ T -matrix operator, unitarity relations, and phase space □ Hermitian unitarity, the Lippmann-Schwinger equation, and spherical waves in the scattering states □ Cross section, and the optical theorem □ Boltzmann H -theorem

^{*}oller@um.es

2 Two-body scattering. Partial-wave amplitude expansions

Two-body scattering, and Mandelstam variables □ Normalization, element of phase space, cross section and unitarity □ Rotational invariance

2.1 Partial-wave amplitudes in the ℓSJ basis

States, standard Lorentz transformation, and transformation under rotations □ States $|p\ell m, \sigma_1 \sigma_2\rangle$ with definite orbital angular momentum, and transformation under rotations □ ℓSJ states with definite total angular momentum □ Partial-wave amplitudes, and calculation □ Identical particles, unitary normalization, and including isospin □ Time-reversal invariance, and PWAs are symmetric □ Unitarity in PWAs □ Lippmann-Schwinger equation in PWAs, phase shifts and inelasticity

2.2 Partial-wave amplitudes in the helicity basis

Helicity, monoparticle states, and representation of the rotation group □ Two-particle states, common $R(\hat{p})$, and normalization □ Partial-wave states, normalization, and Bose-Einstein symmetry □ Partial-wave amplitudes with definite helicities

3 Crossing symmetry

Crossing symmetry, physical regions, and analyticity □ Example of $\pi\pi$ scattering, and isospin amplitudes □ Crossed channel cuts, and the Lippmann-Schwinger equation □ Kinematical singularities, and Lorentz invariant amplitudes □ Cuts in the s plane for PWAs due to poles and cuts in crossed channels □ Crossed cuts in PWAs for nonrelativistic scattering

4 The N/D method and CDD poles

Set up for the N/D method □ CDD poles, and additional solutions □ General formula for PWAs without LHC □ Generalization to coupled channels

5 General parameterization for a PWA and reaching unphysical Riemann sheets

General formula for a PWA, the matrices $\hat{\mathcal{N}}(s)$ and $\hat{G}(s)$ □ Change to the second Riemann sheet of $g(s)$, and different Riemann sheets of $T(s)$

5.1 Dynamically generated resonances & pre-existing ones

Low lying σ pole, radius of convergence, and calculation of the $I = \ell = 0$ $\pi\pi$ PWA □ Natural-value estimate for $a(\mu)$, pole of the σ , and dynamically generated resonances □ Calculation of the $I = \ell = 1$ $\pi\pi$ PWA, and fine tuning of $a(\mu)$ to a large negative value □ Second CDD pole, and the $\rho(770)$ as pre-existing or elementary resonance

6 Final(Initial)-state interactions. Watson theorem

Feeble probes, unitarity, PWAs, and Watson's theorem □ Generalization to coupled channels, using the N/D method, and an Omnés function

A The Sugawara-Kanazawa theorem and number of subtractions in dispersion relations

The Sugawara-Kanazawa theorem □ Corollaries

Brief introduction

We cover some basic topics on scattering theory, emphasizing unitarity and analyticity of the S matrix while keeping an eye on phenomenology. These lectures could be useful to those interested in scattering processes that cannot be calculated by using only perturbative techniques in Quantum Mechanics or in Quantum Field Theory. The different concepts here are introduced from a nonperturbative point of view. The most formal part of the lectures concern the first two chapters, which are the longest ones. The first one is dedicated to formal topics in the theory of the S -matrix, while the second chapter develops in detail the expansion in partial-wave amplitudes of scattering amplitudes and related aspects, like unitarity in partial waves. The third chapter is an introduction to crossing symmetry and its applications. The other chapters are typically of narrower scope, typically more specific, and treat several interesting topics in partial-wave amplitudes: The N/D method, CDD poles, unphysical Riemann sheets and resonance poles there, their nature, and final-state interactions. There is an added appendix dedicated to the relatively unknown Sugawara-Kanazawa theorem, which is applicable to many situations of interest in phenomenology. There is a bunch of exercises along the manuscript typically asking the reader to complete some derivations or deduce new results.

These lectures are rather self-contained and could be used with only limited background knowledge on the subject. Books like [1–6] have been often consulted by the author along his research trajectory and they have imprinted these lectures. In preparing them I have also used my previous book [7]. A large part of this material was presented in a short course given at the Instituto de Física de la Facultad de Ingeniería de la Universidad de la República Uruguay.
